Section 12.6
Systems of Nonlinear Equations
OBJECTIVE 1

1. Solve a System of Nonlinear Equations Using Substitution
1. If the system contains two variables and if the equations in the system are easy to graph, then graph them. By graphing each equation in the system, you can get an idea of how many solutions a system has and approximately where they are located.

2. Extraneous solutions can creep in when solving nonlinear systems, so it is imperative that all apparent solutions be checked.
Solve the following system of equations:

\[
\begin{align*}
    y &= 3x + 10 \\
    x^2 + y^2 &= 50
\end{align*}
\]
OBJECTIVE 2

2. Solve a System of Nonlinear Equations Using Elimination
Solve the following system of equations:

\[
\begin{align*}
    x^2 + y^2 &= 4 \\
    x^2 - 2x + y^2 &= 0
\end{align*}
\]
Solve the following system of equations:

\[
\begin{cases}
  x^2 + y^2 = 49 \\
  y^2 - 6x = 49
\end{cases}
\]
Solving a System of Nonlinear Equations

Solve the following system of equations:

\[
\begin{align*}
xy &= 4 \\
4x^2 + y^2 &= 20
\end{align*}
\]
EXAMPLE

Solving a System of Nonlinear Equations

Solve the following system of equations:

\[
\begin{align*}
  y &= \frac{4}{x - 2} \\
  x^2 - 4x + y^2 - 4 &= 0
\end{align*}
\]
EXAMPLE  Running a Long Distance Race

In a 50-mile race, the winner crosses the finish line 1 mile ahead of the second-place runner and 4 miles ahead of the third-place runner. Assuming that each runner maintains a constant speed throughout the race, by how many miles does the second-place runner beat the third-place runner?
